# AUTOMATED ENTRANCES MADE EASY WITH KORYDE!

'FACT': give a bricklayer 4 drums of cable, a coil of ducting and a wiring diagram and ask him to run cables into the pier for intercom, keypad, safety beams, safety edge, fireman's switch and motors and you can guess what the result will be? A disaster!

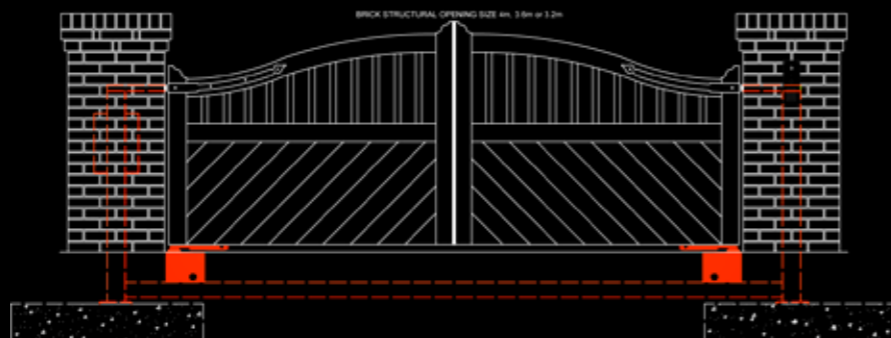

Most bricklayers will admit they are not electricians and can't be bothered with the hassle of building cables into their piers for the automation engineer.

The Koryde system makes it so easy for the bricklayer, that he will even enjoy the experience of building the cables into the pier!

## WHY USE KORYDE?

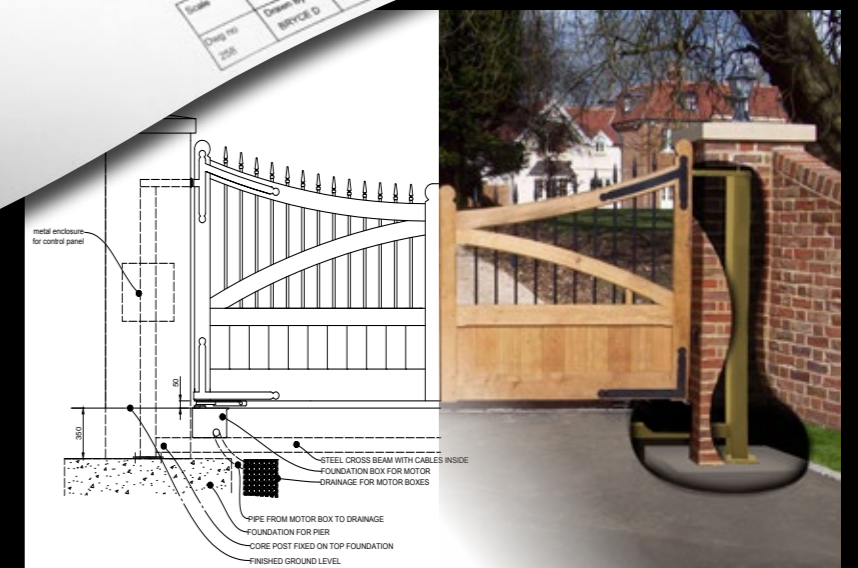

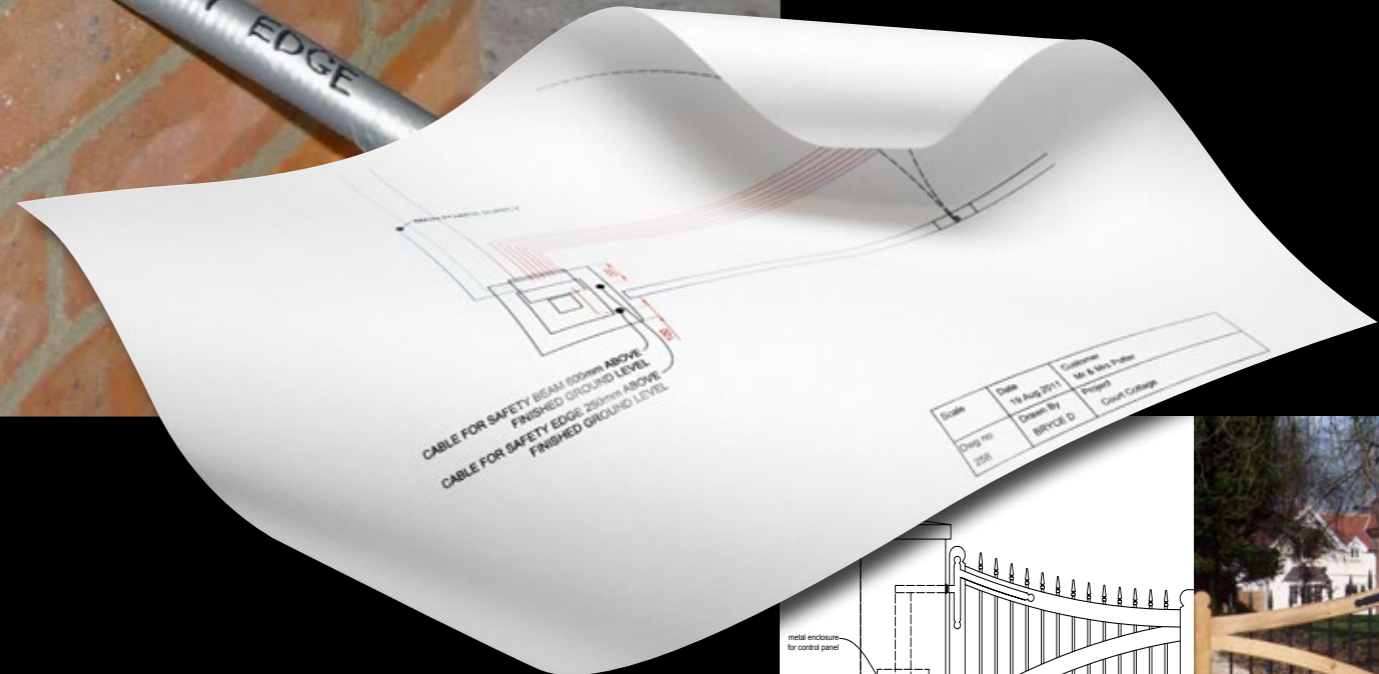

Builders no longer have the worry of leasing with different contractors when setting out and building entrances...

- Koryde core posts take away the painstaking nightmare of trying to get the bricklayer, electrician, gate manufacture, gate installer and automation engineer to combine all their trades and leasing together to create a prestigious entrance.
- The Koryde system streamlines production by at least five times, cuts site foremans time by six times and reduces the risk of work being re-done due to incorrect construction by at around eight times.

- A builder doesn't even need to ask the ground worker to run a duct across the drive for cabling as cables are run through the steel beam - another cost saving!!!
- Precision setting out of hinge geometry and motor positions carefully manufactured before site installation.
- For the tidiest and best quality gate installation use Koryde...
- Why be content with an unsightly surface fixed control panel enclosure screwed to the side of your pier, when the Koryde system produces a flush fitted recessed enclosure that couldn't be more pleasing to the eye.

- No more surface fixed cables! Whenever the Koryde system is installed, all cables will be concealed within the pier.
- Motor foundation boxes are welded to the cross steel beam giving the maximum stability and strength.
- Thanks to the Koryde core posts no more unsightly hinge fixing brackets as all hinges are welded to the core post with minimal metalwork showing on the face of the bricks.
